**General System Description:**

Live Earth Imaging, Inc. will be deploying three geostationary orbit private remote sensing satellites. The expected, nominal longitude positions are approximately 90° West, 30° East, and 150° East to provide nearly global coverage. Each satellite will have two sensors with each providing second by second daytime imagery and every 5 second at night to provide true 24/7 imagery and related data. The sensors will record in visible and near IR. The Narrow Field Sensor will be pointable and steerable to any place in the observable hemisphere and once positioned and persistently record imagery of that region. The Hemispherical sensor shall record the full observable hemisphere to provide true persistent imaging. The goal of the system is to provide end users with imagery and related data within five seconds of imagery capture.
