Change History Log

Revision	Effective Date	Description of Changes (Reference the CCR & CCB/ERB Approve Date)	Sections Affected
0200-	July 26, 2013	This version incorporates 474-CCR-13-1104 which was approved by JPSS Ground ERB on the effective date shown.	
0200A	Jan 16, 2014	This version incorporates 474-CCR-13-1336 which was approved by JPSS Ground ERB on the effective date shown.	
0200A1	Oct 23, 2014	This version incorporates 474-CCR-14-2091 which was approved by the JPSS Ground ERB for CO10 on the effective date shown.	
0200B	Jan 21, 2015	This version incorporates 474-CCR-14-2168 and 474-CCR-14-2203 which was approved by the JPSS Ground ERB on the effective date shown.	
0200C	May 21, 2015	This version incorporates 474-CCR-14-2288 and 474-15-2427 which was approved by the JPSS Ground ERB on the effective date shown.	
0200D	July 28, 2015	This version incorporates 474-CCR-15-2434 and 474-CCR-15-2506 which was approved by the JPSS Ground ERB on the effective date shown.	
0200E	Feb 12, 2016	This version incorporates 474-CCR-15-2657 and 474-CCR-16-2768 which was approved by the JPSS Ground ERB on the effective date shown.	
0200F	Jun 07, 2016	This version incorporates 474-CCR-16-2939 which was approved by the JPSS Ground ERB on the effective date shown.	
0200G	Aug 03, 2017	This version incorporates 474-CCR-17-3459 which was approved by the JPSS Ground ERB on the effective date shown.	
0200H	May 01, 2018	This version incorporates 474-CCR-17-3684 which was approved by the JPSS Ground ERB on the effective date shown.	
I	Sep 26, 2019	This version incorporates 474-CCR-19-4497 which was approved by the JPSS Ground ERB on Sep 03, 2019 and by the JPSS Ground Segment CCB on the effective date shown.	
J	Feb 27, 2020	This version incorporates 474-CCR-19-4759 which was approved by the JPSS Ground ERB on Feb 18, 2020 and by the JPSS Ground Segment CCB on the effective date shown.	
K	Aug 26, 2021	This version incorporates 474-CCR-21-5445 which was approved by the JPSS Ground ERB on May 07,	

		2021 and by the JPSS Ground Segment CCB on the effective date shown.

1 INTRODUCTION

1.1 Scope

The Joint Polar Satellite System (JPSS) Algorithm Specification for VIIRS RDR/SDR - Volume II: Data Dictionary contains the specifications for the format of the VIIRS Raw Data Records (RDRs) and Sensor Data Records (SDRs). This specification includes the format of the Hierarchical Data Format Release 5 (HDF5) files, as well as the product definitions. These formats are available to external users of the JPSS. For an overview of the data product formats, see 474-00001-01, JPSS CDFCB-X Vol I. For an overview of the metadata formats for data products, see 474-00448-02-01, JPSS Algorithm Specification Volume II: Data Dictionary for the Common Algorithms.

1.2 Organization

Section	Contents
Section 1	Provides information regarding the scope, and organization of this document, as reference material only.
Section 2	Lists parent documents and related documents that were used as sources of information for this document or that provide additional background information to aid understanding of the interface implementations.
Section 3	Provides an overview of the HDF5 UML for the data product types.
Section 4	Provides a description of the contents of each JPSS RDR.
Section 5	Provides a description of the contents of each JPSS TDR if applicable.
Section 6	Provides a description of the contents of each JPSS SDR.
Section 7	Provides a description of relevant Look-Up Tables (LUTs) and Processing Coefficient Tables (PCTs).
Section 8	Provides a description of each Intermediate Product if applicable.
Appendix A	Provides the Data Mnemonic to Interface Mapping for the data products in this volume.
Appendix B	Provides common RDR static header values in this volume.
Appendix C	Provides a mapping of the quality flags by sensor and product that are reportable to the associated data product quality flag Test ID used in the processing environment.
Appendix D	Provides reference to acronyms and glossary of terms found within the JPSS Program Lexicon (470-00041).
Attachment A	Provides the list of applicable xml files for this Data Dictionary.

2 RELATED DOCUMENTATION

The latest JPSS documents can be obtained from URL:

https://jpssmis.gsfc.nasa.gov/frontmenu_dsp.cfm. JPSS Project documents have a document number starting with 470, 472 or 474 indicating the governing Configuration Control Board (CCB) (Program, Flight, or Ground) that has the control authority of the document.

3 UML FOR HDF5 PRODUCTS

3.1 RDR HDF5 Details

Figure 3.1-1, Science and Diagnostic RDR Generalized UML Diagram, depicts the HDF5 RDR file organization as a Unified Modeling Language (UML) class diagram for Science and Diagnostic RDRs. This also describes the science calibration RDRs generated by OMPS. Figure 3.1-2, Dwell, Dump, and Telemetry RDR Generalized UML Diagram, depicts the HDF5 RDR file organization as a UML Class Diagram for Dwell, Dump and Telemetry RDRs.

Each HDF5 RDR file contains an HDF5 Root Group, '/', a Data_Products Group, one or more Product Groups (CollectionShortName), and an All_Data Group containing one or more (CollectionShortName)_All groups. The latter group contains the Dataset_Array which holds the common RDR structures of Consultative Committee for Space Data Systems (CCSDS) structured APs. For Science and Diagnostic RDRs a Spacecraft Diary Group is also included in the Data_Products group. The Product Groups and Spacecraft Diary Group both contain datasets - an Aggregation Dataset (CollectionShortName_Aggr) and Granule Datasets (CollectionShortName_Gran_n - where n indicates the nth granule in a temporal aggregation of granules (0 .. n-1)). A granule is a general term used to describe the minimum quanta of data collected per processing period, generally on the order of tens of seconds. For the definition and organization of the metadata attributes contained in the HDF5 files, see 474-00448-02-01, JPSS Algorithm Specification Vol II: Data Dictionary for the Common Algorithms. Attributes that are specific to a particular RDR are listed with the specific RDR's data format definition. Note: In the UML diagrams, an '*' following the name of an attribute indicates an element with exceptions; see JPSS Algorithm Specification Vol II: Data Dictionary for the Common Algorithms, for the details of the exception.

Figure: 3.1-1 Science and Diagnostic RDR Generalized UML Diagram

Figure: 3.1-2 Dwell, Dump, Telemetry, and Spacecraft Diary (when requested separately) RDR Generalized UML Diagram

3.2 TDR/SDR HDF5 Details

Figure 3.2-1, Generalized UML Diagram for HDF5 SDR/TDR Files, depicts the HDF5 SDR/TDR organization as a Unified Modeling Language (UML) class diagram. Each HDF5 SDR/TDR file contains an HDF5 Root Group, '/', a Data Products Group, Product Groups (Collection Short Name), an optional Geolocation Group (depending upon packaging option, see the JPSS CDFCB-X Vol. I for a description of the geolocation packaging), and an All Data Group (dataset arrays). The Product Groups and Geolocation Group both contain datasets - an Aggregation Dataset (Collection Short Name_Aggr) and Granule Datasets (Collection Short Name_Gran_n) - where n indicates the nth granule in a temporal aggregation of granules (0 .. n-1). A granule is a general term used to describe the minimum quanta of data collected per

processing period, generally on the order of tens of seconds. For the definition and organization of the metadata attributes contained in the HDF5 files, see 474-00448-02-01, JPSS Algorithm Specification Vol II: Data Dictionary for the Common Algorithms. Attributes that are specific to a particular SDR/TDR are listed with the specific SDR/TDR's data format definition. For the generalized formats and packaging options for the Geolocation data, see the JPSS CDFCB-X Vol. I.

4 JPSS RAW DATA RECORDS (RDRS)

The following paragraphs describe the structure and contents of the RDR granules formed by the JPSS ground processing software. The ground processing software generates several RDRs for each sensor by accumulating one or more specific APs into a single collection. The accumulated APs are not byte-aligned or otherwise altered. They are merely collected and placed into storage in the order that they are received. The following paragraphs describe the binary packaging structure for these accumulated APs. Table 4-1, Common RDR Structure, shows the common JPSS RDR Structure. All JPSS RDRs are based on the same generic granule storage framework and is illustrated conceptually in Figure 4-1 Common RDR Layout.

The detailed structure and contents of the APs are documented in the Mission Data Format Control Book (MDFCB) for each mission, GSFC 429-05-02-42 for S-NPP, 472-00251 for JPSS-1, and 472-00717 for JPSS-2. For more information on AP formatting, see the Recommendations for Advanced Orbiting Systems, Networks and Data Links, CCSDS 701.0-B-2, Section 3.3.3.

Table: 4-1 Common RDR Structure

Field Name	Description
Static Header	Static header describing the RDR
APID List	Array of structures that contains information about each APID that is collected in the RDR
Packet Tracker	Array of structures that contains information about each AP that is in the RDR
AP Storage area	General buffer where the APs are stored back-to-back in the order that they are received

**Figure: 4-1 Common RDR Layout**

4.1 Common RDR Structures

The following section defines these structures and provides methods for determining the variable length RDR components.

Description/ Purpose	The following tables describe the four structures found in the common RDR Structure. The common RDR Structure granules are referenced by the HDF5 Object and Reference Region pointers in the CollectionShortName_Aggr and CollectionShortName_Gran_# datasets, respectively.
File-Naming Construct	See the JPSS CDFCB-X Vol. I-Overview, Section 3 for details.
File Size	Nominally specified per RDR
File Format Type	Big Endian Binary (structure stored within HDF5)
Production Frequency	Common structure created for each RDR granule Granule durations specified per RDR

Data Content and Data Format	Each RDR has a single RDR Static Header and a dynamic Application Packet content area with three major entries: 1) APID List, 2) Packet Tracker List, and 3) Application Packet Storage Area. Table 4.1-1, RDR Static Header, details the spacecraft and sensor that the RDR data originated from, the type of data the RDR contains, and the start and end boundary times of the RDR granule. It also provides byte offset information needed to access individual APs and the number of AP types that are contained in the RDR. Tables 4.1-2, 4.1-3, and 4.1-4 define the Dynamic Application Packet content area. Table 4.1-2, RDR APID List, defines the structure used to identify the AP data type and it provides information necessary for accessing the RDR Packet Tracker. The APID List has details for each APID including number expected and received. Table 4.1-3, RDR Packet Tracker provides information about individual APs. Table 4.1-4, Application Packet Storage Area, describes the storage area containing the APs. Table 4.1-5, Application Packet Tables, provides explanations of the fields given for each RDR described in the following sections.

Table 4.1-1, RDR Static Header, details the spacecraft and sensor that the data originated from, the type of the data the RDR contains, and the start and end boundary times of the RDR granule. The RDR contains APs that have observation times which are greater than or equal to the start boundary and less than the end boundary time. The total size of the RDR Static Header is 72 bytes.

Table: 4.1-1 RDR Static Header

Field Name	Data Type	Description
satellite	char[4]	Source satellite name as found in JPSS CDFCB-X Vol. I, Table 3.4.1-1, Spacecraft ID.
Sensor	char[16]	The RDR sensor name in a case-sensitive string (Example: "VIIRS", "ATMS", "CrIS", etc. See Appendix B, Common Static Header Values, for specific values.)
typeID	char[16]	The RDR type in an upper case string (Example: "SCIENCE", "DIAGNOSTIC", "TELEMETRY", "MEMORY DUMP", "DWELL". See Appendix B, Common Static Header Values, for specific values.)
numAPIDs	UInt32	The number of different types of expected APIDs that make the RDR. (numAPIDs is specific for each type of RDR, see Appendix B, Common Static Header Values, for specific values.)
apidListOffset	UInt32	Byte offset of the APID List (this is equivalent to the size of the static header: 72). The APID List starts immediately after the Generic RDR Static Header. Note: Always use this value to find the APID address.

Field Name	Data Type	Description
pktTrackerOffset	UInt32	Byte offset from the beginning of the Common RDR to the Packet Tracker list Note: Always use this value to find the Packet Tracker list.
apStorageOffset	UInt32	Byte offset from the beginning of the Common RDR to the AP Storage Note: Always use this value to find the AP Storage.
nextPktPos	UInt32	Byte offset from the beginning of the Application Packet Storage Area (apStorageOffset) to the end of valid data within the Application Packet Storage Area
startBoundary	int64	All APs occur at or after this time in IDPS Epoch Time (IET) format. Note IET begins January 1, 1958 and is measured in microseconds. For more information on IET see JPSS CDFCB-X Vol. I, Section 3.3.1.
endBoundary	int64	The RDR non-inclusive boundary time in IET format. All APs occur before this time.

Table 4.1-2, RDR APID List, details the APIDs that are in the RDR. The number of elements in the list is equal to the numAPIDs field in the RDR Static Header. The size of a single RDR APID list element is 32 bytes.

Table: 4.1-2 RDR APID List

Field Name	Data Type	Description
name	char[16]	Shortname describing the data type (Example: M01 for VIIRS. See individual RDR sections for specific values.)
value	UInt32	This field stores an APID that is in the RDR.
pktTrackerStartIndex	UInt32	The first index in the pktTracker array that will contain an AP of this APID. This index is zero based.
pktsReserved	UInt32	This field stores the number of APs reserved for this APID in this RDR. This value accounts for the worst case expected for the temporal granule period. Due to variability in scan rates, the actual number of packets received can be less than the "reserved" and still be 100% complete as shown in the metadata.
pktsReceived	UInt32	The number of APs of this APID that have been received for this RDR

Each RDR contains an array of Packet Trackers. Table 4.1-3, RDR Packet Tracker, details information about the AP and its location in the storage buffer. The number of elements in this array is equal to the total number of packets that are expected for all expected APIDs. The size of a single RDR Packet Tracker is 24 bytes.

Table: 4.1-3 RDR Packet Tracker

Field Name	Data Type	Description
obsTime	int64	The IET observation time of the AP as derived from the CCSDS Secondary Header of the AP or associated with the segmented group of the APID.
sequenceNumber	int32	The 14 bit sequence number extracted from the Primary Header's Packet Sequence Control word of the AP. This is used to track segmented packets and their location.
size	int32	The AP size in bytes as received
offset	int32	The AP begins at this offset from the beginning of the AP Storage Area. From the beginning of the RDR, the AP is at "offset" + apStorageOffset. (offset = -1 for packets not received).
fillPercent	int32	Percentage of fill data included in the AP. Based on received and expected bytes per AP with valid values being 0-100% reported to the nearest %. Any AP with fill data (even one byte) will be reported with at least 1% fill data. Under normal conditions the value is 0. If the primary AP header indicates a secondary AP header is present, and the time code of the secondary AP header is fill, the AP is not made available. In the event that an AP is repaired, resulting in less fillPercent, a repaired RDR granule may be produced. See JPSS CDFCB-X, Vol. I, Section 3.5.7 for more information on Repair Granules.

Table 4.1-4 Application Packet Storage Area, describes the AP storage area.

Table: 4.1-4 Application Packet Storage Area

Field Name	Data Type	Description
apStorage	Array of unsigned int8	Storage area where application packets are stored as they arrive in consecutive order

Table 4.1-5, Application Packet Tables, provides explanations of the fields given for each RDR described in the following sections. APIDs are listed in the JPSS Alg. Spec. for VIIRS Volume IV: SRSPF (474-00448-04-06).

Table: 4.1-5 Application Packet Tables

APID Short Name	Description	Value APID ₁₀
Short name of this Application Packet as an upper-case string	Brief description of this application packet	Unique Application packet ID value

Note: Grouped or segmented packets contain mission data exceeding the size of a single CCSDS packet.

Accessing APs can be achieved in two fashions; Random Access or Sequential Access.

To access APs in random order by AP type:

- Get the range for a specific type of data from the APID List
 - o Find desired AP type using name field

-
-
- o Get pktTrackerStartIndex
 - o Get pktsReserved
 - Loop over the elements in Packet Tracker array starting at pktTrackerStartIndex
 - o Get offset (if -1 stop processing no packet received)
 - o Get size
 - o Access the AP by adding the offset to the apStorageOffset value found in the Static Header
 - o Extract size (the AP size in bytes) from the AP Storage Area
 - o Repeat above for pktsReserved

To access APs in sequential order:

- Get the apStorageOffset from the Static Header to determine memory location for start of APs in AP Storage Area
- Get the nextPktPos from the Static Header (The nextPktPos value indicates the end of valid RDR data within the AP Storage Area)
- Parse AP's manually by reading the primary header, accessing the size of the packet, and accessing the user data section in the CCSDS packet

Repeat until nextPktPos equals current position.

4.2 VIIRS RDR Overview

Data Mnemonic	Science: RDRE-VIRS-C0030 Diagnostic: RDRE-VIRS-C0032 Telemetry-Diagnostic: RDRE-VIRS-C0036 Telemetry: RDRE-VIRS-C0031 Memory Dump: RDRE-VIRS-C0035
Description/ Purpose	The VIIRS sensor provides for the retrieval of imagery, aerosol, cloud, land, ocean, and earth radiation budget EDRs using visible and IR channels. VIIRS has 22 spectral bands over the 0.4 to 12.5 micron range. There are 15 “reflective” (8 Visible [VIS], 2 Near Infra-red [NIR], and 5 Short Wave Infrared[SWIR]) bands from 0.4 to 2.3 microns, three “mixed” Mid-Wave Infrared (MWIR) bands from 3.5 to 4.1 microns, and four “emissive” Long Wave Infrared (LWIR) bands from 8.4 to 12.5 microns.

5 TEMPERATURE DATA RECORDS (TDRS)

Not Applicable

6 SENSOR DATA RECORDS (SDRS)

SDR processing is instrument-specific and is an event-driven process. All instrument data required to create an SDR granule is contained within relevant Raw Data Record (RDR) granule(s). Processing an RDR into an SDR involves unpacking and de-commutating the Application Packet (AP) data, as necessary, applying calibration (radiometric, geometric, engineering), and finally geo-locating, as needed, using ephemeris and attitude information and earth model information.

An SDR contains the following:

- Calibrated sensor data
- Geolocation data (where applicable)
- Quality flags
- Metadata at the granule and aggregation level

6.1 SDR Granule Size

The granule sizes for SDRs given below are not absolute over the life of the sensor. Application software will need to determine the SDR array size by using the HDF5 software API.

The SDR granule is the smallest component of an HDF5 aggregation. Each HDF5 file will be composed of an aggregation of contiguous granules covering the time period specified in a request (the range being from one granule to the total number of granules in one orbit). To correctly use the HDF5 SDR files, operational software will need to determine the SDR array size by examining the appropriate HDF5 API's returned values per granule, or aggregation, as desired. The estimated size for each SDR granule is given in the SDR Data Unit Format.

6.2 Visible/Infrared Imager Radiometer Suite Moderate Resolution SDR

VIIRS Moderate Resolution Band (M-Band) summarizes the M-Band channels and their respective data mnemonics. The SDRs are available separately, but they are presented in this section grouped together in order to minimize the repeated information.

Table: 6.2-1 VIIRS M-Band SDRs

Data Mnemonic	Description/Purpose
SDRE-VM01-C0030	Band M1 - radiance & reflectance at nominal center wavelength 412 nm.
SDRE-VM02-C0030	Band M2 - radiance & reflectance at nominal center wavelength 445 nm.
SDRE-VM03-C0030	Band M3 - radiance & reflectance at nominal center wavelength 488 nm.
SDRE-VM04-C0030	Band M4 - radiance & reflectance at nominal center wavelength 555 nm.
SDRE-VM05-C0030	Band M5 - radiance & reflectance at nominal center wavelength 672 nm.
SDRE-VM06-C0030	Band M6 - radiance & reflectance at nominal center wavelength 746 nm.
SDRE-VM07-C0030	Band M7 - radiance & reflectance at nominal center wavelength 865 nm.
SDRE-VM08-C0030	Band M8 - radiance & reflectance at nominal center wavelength 1240 nm.
SDRE-VM09-C0030	Band M9 - radiance & reflectance at nominal center wavelength 1378 nm.
SDRE-VM10-C0030	Band M10 - radiance & reflectance at nominal center wavelength 1610 nm.
SDRE-VM11-C0030	Band M11 - radiance & reflectance at nominal center wavelength 2250 nm.
SDRE-VM12-C0030	Band M12 - radiance & emittance at nominal center wavelength 3700 nm.

Data Mnemonic	Description/Purpose
SDRE-VM13-C0030	Band M13 - radiance & emittance at nominal center wavelength 4050 nm.
SDRE-VM14-C0030	Band M14 - radiance & emittance at nominal center wavelength 8550 nm.
SDRE-VM15-C0030	Band M15 - radiance & emittance at nominal center wavelength 10763 nm.
SDRE-VM16-C0030	Band M16 - radiance & emittance at nominal center wavelength 12013 nm.

Data Mnemonic	See Table 6.2-1, VIIRS M-Band SDRs
Description/ Purpose	See Table 6.2-1, VIIRS M-Band SDRs The Visible/Infrared Imaging/Radiometer Suite (VIIRS) collects visible/infrared imagery and radiometric data. There are 16 detectors along-track in the M-Bands and 32 detectors along-track in the Imagery Resolution Bands (I-Band). <i>General Information on VIIRS SDRs</i> As the VIIRS telescope rotates across-track, every 1.7872 seconds, arrays of pixels are captured, creating a ~3000 km x ~12 km (across-track x along-track) image of the earth. Since VIIRS does not capture an entire earth image instantaneously, there is an inherent time delay in collecting a full set of pixels for each scan, and from scan to scan. From scan to scan, the delay is set such that the next scan is exactly one full field-of-regard, the detectors' horizontal along-track coverage, away from the previous scan. For instance the first row of detectors will be adjacent to the last row of detectors on the next scan. Although the output seen in the SDR is an array of data, for a number of reasons described below, the actual measurements from VIIRS are not perfectly contiguous within the array. Each geolocation data point should be used to accurately georeference the data, especially when viewing data from multiple scans. Since the rotation period is a specification which has a tolerance of +/- .45%, the actual rotation rate can vary. The actual value should be calculated from the scan times provided in the geolocation. The processing system of S-NPP and JPSS-1 is designed to allow for this specification tolerance. The processing software uses time rather than data size to define granules, and in order to never "overflow" the processing buffer size of one granule, the size of the internal granule is slightly smaller than the expected 85.7856 seconds (1.7872 seconds * 48 scans/second). This has the advantage of never allowing more scans than can fit in a granule, but has the disadvantage of generating scenarios where fewer than the nominal number of scans per granule can occur. Although this can happen for a number of other reasons, for a nominal granule containing 48 scans, on occasion there can be 47 scans due to the design to allow for tolerance in scan rates. The number of actual scans in the granule is stored in the granule metadata item N_Number_Of_Scans. Since granule array dimensions are fixed in size, the last scan in this 47 of 48 scan case will be filled with a "does not exist" type of fill value. The corresponding geolocation will also be filled since the values in the array are simply artifacts of the processing system. More information on fill values can be found in JPSS CDFCB-X Vol. I, Section 3.5.

	For all nominal S-NPP and JPSS-1 orbits (afternoon Local Time of Ascending Node) the first detector produces the 16th scan line (or pixel row). When referring to the "bad detector" flag array, the first array element represents detector 1 (which for the M-Band is pixel row 16). Note: VIIRS auxiliary data, such as relative spectral response curves, reference the detector number and not scan line. While the geolocation angles included with VIIRS SDRs are with respect to the Geoid, the calibrated TOA reflectance is calculated using the terrain corrected solar zenith angle. Note that radiances are not corrected for out of band contributions.
	Moderate and Imagery Resolution Aggregation and Bow-tie Deletion VIIRS fundamental spatial measurement unit is a sample, however pixels are reported in the SDR product. The projected size on the ground of samples gets larger at larger scan angles off nadir due to the increased distance from the sensor and the observed angle of incidence. Samples are created from pixels by averaging (aggregating) across-track which creates more horizontally uniform pixels. The samples with a scan angle within 32 degrees of nadir, have a smaller size when projected on the ground, and so are aggregated 3:1 in the scan (across-track) dimension. Those occurring at scan angles between ~32 degrees and ~45 degrees off nadir are aggregated 2:1 in the scan dimension. The samples at scan angles greater than ~45 degrees off nadir are not aggregated. The aggregation of samples across the scan reduces the total number of samples; however, there is still a factor of two increase in the projected ground size of each pixel from nadir to maximum scan angle. This is referred to as the bow-tie effect (See Figure 6.2-1, VIIRS Bow-Tie Effect), as the projected scan track for all the pixels in one scan generally resembles a bow-tie. The additional pixel rows, in the two outside aggregation zones mentioned above, duplicate coverage from scan to scan, and are deleted. The deletion process impact for M-Band pixels is shown in Figure 6.2-2, VIIRS Bow-tie Deletion. This results in about half of the bow-tie overlapping pixels not being transmitted to ground. The values in the resulting product arrays are filled with the on-board pixel trim fill values during ground processing.

6.2.4 VIIRS M1 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.4-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ...”M16”.

Table: 6.2.4-1 VIIRS M1 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

6.2.5 VIIRS M2 SDR Data Content Summary

The VIIRS M2-SDR data arrays structures are summarized below in Table 6.2.5-1, VIIRS M2 SDR Data Content Summary.

6.2.7 VIIRS M2 SDR HDF5 Details

Figure 6.2.7-1, VIIRS M2 SDR UML Diagram, provides the details on the content and data types of the VIIRS M2 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.2.8 VIIRS M2 SDR Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.8-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ...”M16”.

Table: 6.2.8-1 VIIRS M2 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

6.2.9 VIIRS M3 SDR Data Content Summary

The VIIRS M3-SDR data arrays structures are summarized below in Table 6.2.9-1, VIIRS M3 SDR Data Content Summary.

6.2.11 VIIRS M3 SDR HDF5 Details

Figure 6.2.11-1, VIIRS M3 SDR UML Diagram, provides the details on the content and data types of the VIIRS M3 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.2.12 VIIRS M3 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.12-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ... “M16”.

Table: 6.2.12-1 VIIRS M3 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	

N Quality Summary			
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

6.2.13 VIIRS M4 SDR Data Content Summary

The VIIRS M4-SDR data arrays structures are summarized below in Table 6.2.13-1, VIIRS M4 SDR Data Content Summary.

6.2.15 VIIRS M4 SDR HDF5 Details

Figure 6.2.15-1, VIIRS M4 SDR UML Diagram, provides the details on the content and data types of the VIIRS M4 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.2.16 VIIRS M4 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.16-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ... “M16”.

N_Quality_Summary			
Name	Value	Description	Comments
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

6.2.17 VIIRS M5 SDR Data Content Summary

6.2.19 VIIRS M5 SDR HDF5 Details

Figure 6.2.19-1, VIIRS M5 SDR UML Diagram, provides the details on the content and data types of the VIIRS M5 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.2.20 VIIRS M5 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.20-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ... “M16”.

Table: 6.2.20-1 VIIRS M5 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	

N_Quality_Summary			
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

6.2.21 VIIRS M6 SDR Data Content Summary

The VIIRS M6-SDR data arrays structures are summarized below in Table 6.2.21-1, VIIRS M6 SDR Data Content Summary.

Table: 6.2.21-1 VIIRS M6 SDR Data Content Summary

6.2.23 VIIRS M6 SDR HDF5 Details

Figure 6.2.23-1, VIIRS M6 SDR UML Diagram, provides the details on the content and data types of the VIIRS M6 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.2.24 VIIRS M6 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.24-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ...”M16”.

Table: 6.2.24-1 VIIRS M6 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	

N Quality Summary			
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

6.2.25 VIIRS M7 SDR Data Content Summary

6.2.27 VIIRS M7 SDR HDF5 Details

Figure 6.2.27-1, VIIRS M7 SDR UML Diagram, provides the details on the content and data types of the VIIRS M7 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.2.28 VIIRS M7 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.28-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ... “M16”.

Table: 6.2.28-1 VIIRS M7 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

6.2.29 VIIRS M8 SDR Data Content Summary

The VIIRS M8-SDR data arrays structures are summarized below in Table 6.2.29-1, VIIRS M8 SDR Data Content Summary.

6.2.31 VIIRS M8 SDR HDF5 Details

Figure 6.2.31-1, VIIRS M8 SDR UML Diagram, provides the details on the content and data types of the VIIRS M8 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.2.32 VIIRS M8 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.32-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ...”M16”.

Table: 6.2.32-1 VIIRS M8 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

6.2.33 VIIRS M9 SDR Data Content Summary

6.2.35 VIIRS M9 SDR HDF5 Details

Figure 6.2.35-1, VIIRS M9 SDR UML Diagram, provides the details on the content and data types of the VIIRS M9 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.2.36 VIIRS M9 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.36-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ...”M16”.

Table: 6.2.36-1 VIIRS M9 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

6.2.37 VIIRS M10 SDR Data Content Summary

The VIIRS M10-SDR data arrays structures are summarized below in Table 6.2.37-1, VIIRS M10 SDR Data Content Summary.

6.2.40 VIIRS M10 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.40-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ... “M16”.

6.2.48 VIIRS M12 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.48-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ...”M16”.

6.2.55 VIIRS M14 SDR HDF5 Details

Figure 6.2.55-1, VIIRS M14 SDR UML Diagram, provides the details on the content and data types of the VIIRS M14 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.2.56 VIIRS M14 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.56-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ...”M16”.

Table: 6.2.56-1 VIIRS M14 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

6.2.57 VIIRS M15 SDR Data Content Summary

6.2.60 VIIRS M15 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.60-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ... “M16”.

6.2.64 VIIRS M16 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR are listed in the JPSS Algorithm Specification, Vol II Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR, the items listed in Table 6.2.64-1, VIIRS Moderate Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDRs.

Note that there is a standard granule level metadata item that identifies the M-Band. This metadata item is the “Band_ID” and is set to “M1”, “M2”, “M3”, ... “M16”.

6.2.68 VIIRS M-Band SDR Geolocation HDF5 Metadata Details

The HDF5 metadata elements associated with the M-Band SDR Geolocation are listed in the JPSS Algorithm Specification Vol. II:- Data Dictionary for the Common Algorithms, 474-00448-02-01. The M-Band SDR geolocation metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Moderate Resolution SDR Geolocation, the items listed in Table 6.2.4-1, VIIRS Moderate Resolution SDR Geolocation Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS M-Band SDR Geolocation.

Table: 6.2.68-1 VIIRS M-Band SDR Geolocation Quality Summary Metadata

N_Quality_Summary			
Name	Value	Description	Comments
Percent Missing Data	0- 100%	Percentage of missing pixels (e.g., insufficient data for geolocation)	
Percent Out of Bounds	0 - 100%	Percentage of out of bound pixels. For example, pixels could not be geolocated	
Automatic Quality Flag	0 - 1	Indicates if processing error has occurred	0 = Passed 1 = Failed

6.3 VIIRS Imagery Resolution Band SDR

Table 6.3-1, VIIRS Imagery Resolution Band SDRs summarizes the image band channels and their respective data mnemonics. The SDRs are available separately, but they are presented in this section grouped together in order to minimize the repeated information.

Table: 6.3-1 VIIRS Imagery Resolution Band SDRs

Data Mnemonic	Description/Purpose
SDRE-VI01-C0030	Band I1 - radiance & reflectance at nominal center wavelength 640 nm.
SDRE-VI02-C0030	Band I2 - radiance & reflectance at nominal center wavelength 865 nm.
SDRE-VI03-C0030	Band I3 - radiance & reflectance at nominal center wavelength 1610 nm.
SDRE-VI04-C0030	Band I4 - radiance & reflectance at nominal center wavelength 3740 nm.
SDRE-VI05-C0030	Band I5 - radiance & reflectance at nominal center wavelength 11450 nm.

Data Mnemonic	See Table 6.3-1, VIIRS Imagery Resolution Band SDRs
Description/ Purpose	See Table 6.3-1, VIIRS Imagery Resolution Band SDRs The Visible/Infrared Imager/Radiometer Suite (VIIRS) collects visible/infrared imagery and radiometric data. The five image bands are described in this section. The Imagery Resolution Bands (I-Band) are composed of five separate bands with 32 along-track detectors per band. See Section 6.2, VIIRS M-Band SDRs for general information about VIIRS Moderate and Imagery Resolution Band SDRs.
File-Naming Construct	See the JPSS CDFCB-X Vol. I, Section 3 for details.
File Size	I1: See Table: 6.3.1-1 VIIRS I1 SDR Data Content Summary for size. I2: See Table: 6.3.5-1 VIIRS I2 SDR Data Content Summary for size. I3: See Table: 6.3.9-1 VIIRS I3 SDR Data Content Summary for size. I4: See Table: 6.3.13-1 VIIRS I4 SDR Data Content Summary for size. I5: See Table: 6.3.17-1 VIIRS I5 SDR Data Content Summary for size. Geolocation: See Table: 6.3.21-1 VIIRS I-Band SDR Geolocation Content Summary for size Approximately 316,800 KiB per geolocation granule. Sizes do not include HDF5 overhead or metadata.

6.3.4 VIIRS I1 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the I-Band SDRs are listed in the JPSS Algorithm Specification, Vol. II - Data Dictionary for the Common Algorithms, 474-00448-02-01. The I-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Imagery Resolution SDR, the items listed in Table 6.3.4-1, VIIRS Imagery Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS I-Band SDRs.

Note that there is a standard granule level metadata item that identifies the Imagery Band. This metadata item is the “Band_ID” and is set to “I1”, “I2”, “I3”, ... “I5”.

The HDF5 metadata elements associated with the I-Band SDRs are listed in the JPSS Algorithm Specification, Vol. II - Data Dictionary for the Common Algorithms, 474-00448-02-01. The I-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Imagery Resolution SDR, the items listed in Table 6.3.8-1, VIIRS Imagery Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS I-Band SDRs.

Note that there is a standard granule level metadata item that identifies the Imagery Band. This metadata item is the “Band_ID” and is set to “I1”, “I2”, “I3”, ... “I5”.

6.3.11 VIIRS I3 SDR HDF5 Details

Figure 6.3.11-1, VIIRS I3 SDR UML Diagram, provides the details on the content and data types of the VIIRS I3 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.3.12 VIIRS I3 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the I-Band SDRs are listed in the JPSS Algorithm Specification, Vol. II - Data Dictionary for the Common Algorithms, 474-00448-02-01. The I-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Imagery Resolution SDR, the items listed in Table 6.3.12-1, VIIRS Imagery Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS I-Band SDRs.

Note that there is a standard granule level metadata item that identifies the Imagery Band. This metadata item is the “Band_ID” and is set to “I1”, “I2”, “I3”, ... “I5”.

Table: 6.3.12-1 VIIRS I3 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	

6.3.13 VIIRS I4 SDR Data Content Summary

6.3.15 VIIRS I4 SDR HDF5 Details

Figure 6.3.15-1, VIIRS I4 SDR UML Diagram, provides the details on the content and data types of the VIIRS I4 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.3.16 VIIRS I4 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the I-Band SDRs are listed in the JPSS Algorithm Specification, Vol. II - Data Dictionary for the Common Algorithms, 474-00448-02-01. The I-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Imagery Resolution SDR, the items listed in Table 6.3.16-1, VIIRS Imagery Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS I-Band SDRs.

Note that there is a standard granule level metadata item that identifies the Imagery Band. This metadata item is the “Band_ID” and is set to “I1”, “I2”, “I3”, ... “I5”.

Table: 6.3.16-1 VIIRS I4 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	

N_Quality_Summary			
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)	

6.3.17 VIIRS I5 SDR Data Content Summary

6.3.19 VIIRS I5 SDR HDF5 Details

Figure 6.3.19-1, VIIRS I5 SDR UML Diagram, provides the details on the content and data types of the VIIRS I5 SDR. This UML diagram provides details at the granule level only. In addition to this UML diagram, refer to Section 3.2 TDR/SDR HDF5 Details, Figure: 3.2-1 Generalized UML Diagram for HDF5 SDR/TDR Files, for a complete UML rendering of this product.

6.3.20 VIIRS I5 SDR HDF5 Metadata Details

The HDF5 metadata elements associated with the I-Band SDRs are listed in the JPSS Algorithm Specification, Vol. II - Data Dictionary for the Common Algorithms, 474-00448-02-01. The I-Band SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Imagery Resolution SDR, the items listed in Table 6.3.20-1, VIIRS Imagery Resolution SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS I-Band SDRs.

Note that there is a standard granule level metadata item that identifies the Imagery Band. This metadata item is the “Band_ID” and is set to “I1”, “I2”, “I3”, ... “I5”.

Table: 6.3.20-1 VIIRS I5 SDR Quality Summary Metadata Values

N_Quality_Summary			
Name	Value	Description	Comments
Summary VIIRS SDR Quality	0 - 100 %	Percentage of good quality pixels in granule	
Scan Quality Exclusion	0 - 48	Number of scans in granule excluded from processing (including partial scans)

6.3.24 VIIRS I-Band SDR Geolocation HDF5 Metadata Details

The HDF5 metadata elements associated with the I-Band SDR Geolocation are listed in the JPSS Algorithm Specification Vol. II: - Data Dictionary for the Common Algorithms. The I-Band SDR geolocation metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS Imagery Resolution SDR Geolocation, the items listed in Table 6.3.8-1, VIIRS Imagery Resolution SDR Geolocation Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS I-Band SDR Geolocation.

Table: 6.3.24-1 VIIRS Imagery Resolution SDR Geolocation Quality Summary Metadata

N_Quality_Summary			
Name	Value	Description	Comments
Percent Missing Data	0 - 100 %	Percentage of missing pixels (e.g., insufficient data for geolocation).	
Percent Out of Bounds	0 - 100 %	Percentage of out of bounds pixels. For example, pixels could not be geolocated.	

N_Quality_Summary			
Automatic Quality Flag	0 - 1	Indicates if processing error has occurred.	0 = Passed; 1 = Failed

6.4 VIIRS Day/Night Band (DNB) SDR

Data Mnemonic	SDRE-VDNB-C0030
Description/Purpose	The Visible/Infrared Imaging/Radiometer Suite (VIIRS) collects visible/infrared imagery and radiometric data. The Day/Night Band (DNB) is described in this section. VIIRS DNB measures radiance over a panchromatic band at wavelengths between 500 nm and 900 nm. For more information on the VIIRS SDR data see Section 6.2, VIIRS M-Band SDRs, sub-section Description/Purpose, <i>General Information on VIIRS SDRs</i>. Day/Night Band (DNB) sub-pixels are aggregated on-board and are not subject to pixel trim effects. The DNB pixels maintain a near constant projected spatial size with scan angle.
File-Naming Construct	See the JPSS CDFCB-X Vol. I, Section 3 for details.
File Size	See Table: 6.4.1-1 VIIRS DNB SDR Data Content Summary for size. See Table: 6.4.5-1 VIIRS DNB SDR Geolocation Content Summary for geolocation size.
File Format Type	HDF5
Data Content and Data Format	See Section 6.4.1, VIIRS DNB SDR Data See Section 6.4.5, VIIRS DNB SDR Geolocation

6.4.1 VIIRS DNB SDR Data Content Summary

6.4.4 VIIRS DNB SDR Data HDF5 Metadata Details

The HDF5 metadata elements associated with the VIIRS DNB SDRs are listed in the JPSS Algorithm Specification Vol. II: -Data Dictionary for the Common Algorithms. The DNB SDR metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS DNB SDR, the items listed in Table 6.4.4-1, VIIRS DNB SDR Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS DNB SDRs.

Note that there is a standard granule level metadata item that identifies the Imagery Band. This metadata item is the “Band_ID” and is set to “DNB”.

6.4.8 VIIRS DNB SDR Geolocation HDF5 Metadata Details

The HDF5 metadata elements associated with the DNB SDR Geolocation are listed in the JPSS Algorithm Specification Vol. II: - Data Dictionary for the Common Algorithms, 474-00448-02-01. The DNB SDR geolocation metadata includes all common metadata at the root, product, aggregation, and granule level.

In addition to the common metadata items for the VIIRS DNB SDR Geolocation, the items listed in Table 6.4.8-1, VIIRS DNB SDR Geolocation Quality Summary Metadata are included as name/value pair items under the granule level metadata attribute “N_Quality_Summary”. The listed name/value pair items in the table are the granule level quality summary flags for the VIIRS DNB SDR Geolocation.

Table: 6.4.8-1 VIIRS DNB SDR Geolocation Quality Summary Metadata

N Quality Summary			
Name	Value	Description	Comments
Percent Missing Data	0- 100%	Percentage of missing pixels (e.g., insufficient data for geolocation)	
Percent Out of Bounds	0 - 100%	Percentage of out of bound pixels. For example, pixels could not be geolocated	
Automatic Quality Flag	0 - 1	Indicates if processing error has occurred.	0 = Passed 1 = Failed

7 LOOK-UP TABLES AND PROCESSING COEFFICIENT TABLES

The template used for these formats in this document is described below.

Data Mnemonic: This is a unique identifier. JPSS CDFCB-X Vol. I, 474-00001-01 describes the data mnemonic definition methodology.

Description/Purpose: A brief description of the data format and its purpose.

Instrument: Identification of the Instrument associated with the table.

File-Naming Construct: A description of the file-naming constructs for those data units that apply. JPSS CDFCB-X Vol. I, 474-00001-01 defines file-naming conventions.

File Size: The size of the data file.

File Format Type: The format type of the data file.

Production Frequency: Production frequency is the interval of time for data generation. A production frequency equal to dynamic implies that it is only as requested or as needed.

Data Format/Structure: This defines the actual data format. The definitions provide information for every data element in the data unit.

The following rules apply to all tables:

1. All field names mandatory, unless specified otherwise.
2. Fill data is specified, where applicable.
3. Strings are left-aligned and integers are right-aligned, unless specified otherwise.
4. For information regarding Coordinated Universal Time (UTC) and IDPS Epoch Time (IET) conventions, see the JPSS CDFCB-X Vol. I, 474-00001-01.
5. For all references of the ASCII Standard, the corresponding International Standards Organization (ISO) standard is ISO/IEC 10646. The specific Unicode is UTF8, unless stated otherwise.
6. The fields are presented in order (either top - down or most significant first), unless stated otherwise.

7.1 Look-Up Tables

Algorithm Look-up Table (LUT) files contain tables of pre-computed values used in lieu of real-time algorithm computations to reduce processing resource demands. Table values are typically the result of RTM executions and other environmental model simulations. These data generally cover broad, multi-dimensional parameter spaces which are unique to each algorithm.

7.1.1 VIIRS Bright Pixel PSF MOD LUT

Data Mnemonic	NP_NU-LM0235-000
Description/ Purpose	The VIIRS Bright Pixel PSF MOD LUT file contains the Point Spread Function (PSF) parameters for use in determining Bright Pixels. This file is used in the VIIRS Bright Pixel algorithm.

File-Naming Construct	See the File-Naming Convention for Auxiliary Data Formats, JPSS CDFCB-X Vol. I, 474-00001-01, Section 3.4. The Collection Short Name used in the filename is based on the table - see the JPSS CDFCB-X Vol. I, 474-00001-01, for the applicable Collection Short Names. Version Number Field provides Provenance Version Identifier.
File Size	See Table: 7.1.1-1 VIIRS Bright Pixel PSF MOD LUT for size.
File Format Type	Little Endian Binary
Production Frequency	As needed
Data Content and Data Format	For details see Table 7.1.1-1, VIIRS Bright Pixel PSF MOD LUT Data Format.

7.1.2 VIIRS Bright Pixel Sub Radiance LUT

Data Mnemonic	NP_NU-LM0235-001
Description/ Purpose	The VIIRS Bright Pixel Sub Radiance LUT file contains substitute radiance values used for saturated pixels. Note: The dimension of the radianceValues field includes the Imagery Bands in addition to the Moderate Bands (16 + 5 = 21 total). The Imagery bands are not currently used in the algorithm, but retained in this table for possible future inclusion. This file is used in the VIIRS Bright Pixel algorithm
File-Naming Construct	See the File-Naming Convention for Auxiliary Data Formats, JPSS CDFCB-X Vol. I, 474-00001-01, Section 3.4. The Collection Short Name used in the filename is based on the table - see the JPSS CDFCB-X Vol. I, 474-00001-01, for the applicable Collection Short Names. Version Number Field provides Provenance Version Identifier
File Size	See Table 7.1.2-1 VIIRS Bright Pixel Sub Radiance LUT for size

radianceValues	336	32-bit floating point	Approx 0 - 4300	W/(m ² um sr)	(For TOTAL_M_I_BANDS = 21, Bands 1-16 are Moderate Bands M1- M16, 17-21 are Imagery Bands I1 - I5) 2 Dimensional Array: TOTAL_M_I_BANDS (MOD + IMG) x NUM_BP_RAD_COLU MNS Size of Dimension(s): 21 x 4
File Size	336 Bytes				

7.1.3 VIIRS SDR BB Thermistor LUT

Data Mnemonic	NP_NU-LM0233-021
Description/ Purpose	The VIIRS Blackbody (BB) Thermistor LUT file contains an array of coefficient values for each BB thermistor. These values include voltages, currents, and resistances of the BB circuitry as required for the BB temperature calculation. This file is used in the VIIRS Sensor Data Record (SDR) algorithm.
File-Naming Construct	See the File-Naming Convention for Auxiliary Data Formats, JPSS CDFCB-X Vol. I, 474-00001-01, Section 3.4. The Collection Short Name used in the filename is based on the table - see the JPSS CDFCB-X Vol. I, 474-00001-01, for the applicable Collection Short Names.
File Size	See Table: 7.1.3-1 VIIRS BB Thermistor LUT Data Format for size.
File Format Type	Little Endian Binary
Production Frequency	As needed
Data Content and Data Format	For details see Table 7.1.3-1, VIIRS BB Thermistor LUT Data Format * Unlike the default row-major ordering for all binary tables documented in this volume, values in this table are written to the binary file in column major order rather than row major order. Specifically, the entries are ordered I0[0], V0[0], Rp[0], G[0], Const1[0], I0[1], V0[1], Rp[1], G[1], Const1[1], etc., so that all 5 coefficients may be read at once for each of the 6 blackbody thermistors.

Table: 7.1.3-1 VIIRS BB Thermistor LUT Data Format

Field Name	Length (Bytes)	Data Type	Range of Values	Units	Comments
coeff	240	64-bit floating point	MIN_VAL - MAX_VAL	Varies. 7.1.6 VIIRS SDR Delta C Temperature LUT

Data Mnemonic	NP_NU-LM0233-024
Description/ Purpose	The VIIRS SDR Delta C Temperature LUT file contains the detector specific and temperature dependent (electronics and detector temperature) adjustments to the coefficients of the radiance response functions. This file is used in the VIIRS SDR and Solar Diffuser algorithms.
File-Naming Construct	See the File-Naming Convention for Auxiliary Data Formats, JPSS CDFCB-X Vol. I, 474-00001-01, Section 3.4. The Collection Short Name used in the filename is based on the table - see the JPSS CDFCB-X Vol. I, 474-00001-01, for the applicable Collection Short Names.

EBBT_indices	56	32-bit integer	0 - MAX_VAL	unitless	Dimension Details: Overview: This field provides a roadmap of for the temperature/radiance fields in the table. Values for L_to_EBBT_tp and L_to_EBBT_rad are stored for each emissive band. The number of entries for each band, however, is not identical. This field provides information regarding the number of entries for each band. In addition, a buffer (fill value = -900) is present immediately following the temperature/radiance entries. First dimension (file) corresponds to Bands in order (I4, I5, M12 - M16). The number of L_to_EBBT_tp/ L_to_EBBT_rad entries is provided in this dimension for each band. Second Dimension (bufferIndexNum) corresponds to the index (starting with zero) in the L_to_EBBT_tp/ L_to_EBBT_rad arrays that mark the beginning of the data for each band. Example: EBBT_indices [0][0] = 2549 Means that the I4 Band has 2549 the L_to_EBBT_tp/ L_to_EBBT entries EBBT_indices [0][1] = 0 Means that the I4 Band's data begins at index number 0 (out of the 1,049,999 total indices)

7.1.20 VIIRS SDR Reflective Values LUT

Data Mnemonic	NP_NU-LM0233-042
Description/ Purpose	The VIIRS SDR Reflective Values LUT file contains the values for calibrating reflective bands. The values include first frame to use for OBC average, number of frames to use for OBC average, and RSB moon include. This file is used in the VIIRS SDR algorithm.
File-Naming Construct	See the File-Naming Convention for Auxiliary Data Formats, JPSS CDFCB-X Vol. I, 474-00001-01, Section 3.4. The Collection Short Name used in the filename is based on the table - see the JPSS CDFCB-X Vol. I, 474-00001-01, for the applicable Collection Short Names.
File Size	See Table: 7.1.20-1 VIIRS SDR Reflective Values LUT Data Format for size.
File Format Type	Little Endian Binary
Production Frequency	As needed
Data Content and Data Format	For details see Table 7.1.20-1, VIIRS SDR Reflective Values LUT Data Format

7.1.28 VIIRS RSBAUTOCAL Rotation Matrix LUT

Data Mnemonic	NP_NU-LM0233-080
Description/ Purpose	The VIIRS RSBAUTOCAL Rotation Matrix LUT contains the Solar Diffuser rotation matrix and the SDSM screen rotation matrix. These matrices are used to determine the orientation of the Solar Diffuser with respect to the spacecraft. This file is used in the VIIRS RSB Automated Calibration (RSBAUTOCAL) algorithm.
File-Naming Construct	See the File-Naming Convention for Auxiliary Data Formats, JPSS CDFCB-X Vol. I, 474-00001-01, Section 3.4. The Collection Short Name used in the filename is based on the table - see the JPSS CDFCB-X Vol. I, 474-00001-01, for the applicable Collection Short Names.
File Size	See Table: 7.1.28-1 VIIRS RSBAUTOCAL Rotation Matrix LUT for size.
File Format Type	Little Endian Binary
Production Frequency	As needed

7.1.44 VIIRS DNB Stray Light Correction LUT

Data Mnemonic	NP_NU-LM0233-035
Description/ Purpose	The VIIRS DNB Stray Light Correction LUT contains the radiance levels below which the DNB Stray Light Correction Quality Flag may be set. The values are indexed by solar zenith angles in the terminator region (assumed to be 85 - 105 degrees).
File-Naming Construct	See the File-Naming Convention for Auxiliary Data Formats, JPSS CDFCB-X Vol. I, 474-00001-01, Section 3.4. The Collection Short Name used in the filename is based on the table - see the JPSS CDFCB-X Vol. I, 474-00001-01, for the applicable Collection Short Names.
File Size	See Table: 7.1.44-1 VIIRS DNB Stray Light Correction LUT Data Format for size.
File Format Type	Little Endian Binary
Production Frequency	Rarely
Data Content and Data Format	For details see Table 7.1.44-1, VIIRS DNB Stray Light Correction LUT Data Format

7.1.45 VIIRS SDR Relative Spectral Response LUT

Data Mnemonic	NP_NU-LM0233-090
Description/ Purpose	The VIIRS SDR Relative Spectral Response (RSR) LUT file contains response as a function of wavelength for reflective solar bands, including the DNB RSR, which is used in calculating the D coefficients LUT and for the solar diffuser processing. This file is used in the VIIRS SDR algorithm and in the RSB Automated Calibration (RSBAUTOCAL) algorithm.
File-Naming Construct	See the File-Naming Convention for Auxiliary Data Formats, JPSS CDFCB-X Vol. I, 474-00001-01, Section 3.4. The Collection Short Name used in the filename is based on the table - see the JPSS CDFCB-X Vol. I, 474-00001-01, for the applicable Collection Short Names.

7.1.46 VIIRS SDSM Screen Transmittance LUT

Data Mnemonic	NP_NU-LM0233-091
Description/ Purpose	The VIIRS SDSM Screen Transmittance LUT contains the transmittance screen coefficients for the Solar Diffuser Stability Monitor. This file is used in the VIIRS RSB Automated Calibration (RSBAUTOCAL) algorithm.
File-Naming Construct	See the File-Naming Convention for Auxiliary Data Formats, JPSS CDFCB-X Vol. I, 474-00001-01, Section 3.4. The Collection Short Name used in the filename is based on the table - see the JPSS CDFCB-X Vol. I, 474-00001-01, for the applicable Collection Short Names.

7.2 Processing Coefficient Tables

The S-NPP/JPSS-1 ground system data product generation subsystem uses Processing Coefficient Table (PCT) file parameters. PCT files can be either Automated or Manual coefficient tables. Within the Manual table type are two coefficient classes: Initial and Ephemeral. Sections below describe all three and any tables of that type for the product.

7.2.1 Automated Processing Coefficients

Automated Processing Coefficient (PC) files contain parameters updated and/or created during the processing of the S-NPP/JPSS Data Products by the processing algorithms. The processing environment subsequently uses these files without human review of their contents. Files can be used immediately after creation or in future processing such as the next granule in the production data stream processing.

7.2.1.1 VIIRS RDR/SDR Automated PCs

VIIRS RDR and SDR data production currently use no Automated PCs.

7.2.2 Manual Processing Coefficients

Manual Processing Coefficient (PC) files contain parameters used for S-NPP/JPSS Data Product generation which require human review prior to operational processing environment insertion. Manual Processing Coefficients have two classes:

- Initialization PCTs contain infrequently updated initial parameters sets S-NPP/JPSS uses for data product generation.
- Ephemeral PCTs contain frequently updated parameters sets S-NPP/JPSS uses for data product generation.

7.2.2.1 VIIRS RDR/SDR initialization PCs

VIIRS RDR and SDR data production currently use no Initialization PCs

7.2.2.2 VIIRS RDR/SDR Ephemeral PCT

7.2.2.2.1 VIIRS SDR Bright Pixel Ephemeral PC

Data Mnemonic	DP_NU-LM2020-011
Description/ Purpose	The VIIRS SDR Bright Pixel Ephemeral PC provides tunable processing coefficients for use by the algorithm during execution. The coefficients can be modified (tuned) through a configuration control process in response to algorithm, performance, inputs, sensitivity, etc. changes.
File-Naming Construct	See the File-Naming Convention for Auxiliary Data Formats, JPSS CDFCB-X Vol. I, 474-00001-01, Section 3.4. The Collection Short Name used in the filename is based on the table - see the JPSS CDFCB-X Vol. I, 474-00001-01, Table B-1 for the applicable Collection Short Names.

File Size	See Table: 7.2.2.2.1-1 VIIRS SDR Bright Pixel Ephemeral PC for size.
File Format Type	Little Endian Binary
Production Frequency	As needed
Data Content and Data Format	For details see Table 7.2.2.2.1-1, VIIRS SDR Bright Pixel Ephemeral PC Data Format

7.3 Auxiliary Products

7.3.1 VIIRS RSB AutoCal History AUX

Data Mnemonic	IMPI_VSDH_R0100
Description/ Purpose	The VIIRS Reflective Solar Band (RSB) Automatic Calibration (AutoCal) History contains the last 20 updates of the RSB, F, H, DNB LGS gain, DNB dark Signal, DNB gain ratios, and solar processing data. This data is formatted as Auxiliary data. The Solar Diffuser history is updated every orbit by adding the Solar Diffuser data taken during that orbit. The period over which the Solar Diffuser data is collected is limited to approximately one minute per orbit. Effectivity: S-NPP and JPSS
File-Naming Construct	See the JPSS CDFCB-X Vol. I, 474-00001-01, Section 3 for details of the file naming convention for Auxiliary Data Formats.
File Size	See Table: 7.3.2-1 VIIRS RSB AutoCal History Format for size. Geolocation and metadata attributes are not included. Additional size added by HDF5 packaging is also not included.
File Format Type	HDF5
Production Frequency	As requested
Data Content and Data Format	See Section 7.3.2, VIIRS RSB AutoCal History Format

7.3.4 VIIRS RSB AutoCal History AUX HDF5 Details

Not Applicable

7.3.5 VIIRS RSB AutoCal History AUX Metadata Details

There is no granule level Quality Flags defined as metadata elements in the VIIRS RSB AutoCal History. Therefore, there are no entries in the N_Quality_Summary_Name/Value metadata attributes for this product.

7.3.6 VIIRS RSB AutoCal History Geolocation Details

The VIIRS RSB AutoCal History has no geolocation associated with it.

8 INTERMEDIATE PRODUCTS (IPS)

IPs are defined as a data subset or retrieval by-product that is required within another primary data product's generation sequence or is used as an input to secondary processing or analysis. The IPs defined here can be packaged and delivered to the end-user. Other IPs are generated during the creation of EDRs but are not deliverable and are thus not documented here.

8.1 VIIRS Bright Pixel IP

Data Mnemonic	IMPI_VBPX_R0100
Description/ Purpose	Flag containing the Bright Pixel exclusion condition for the OCC and Albedo EDRs. The output for the IP is a value for each pixel in each band that characterizes the level of contamination of signal by scattered light. The percentage of scattered light is defined to be: $\% \text{ scattered light} = \left \frac{S_{\text{scat}}}{S_{\text{max}}} \right * 100$ Effectivity: S-NPP and JPSS-1
File-Naming Construct	See the JPSS CDFCB-X Vol. I, 474-00001-01, Section 3 for details.
File Size	See Table: 8.1.1-1 VIIRS Bright Pixel Data Content Summary for size

8.1.4 VIIRS Bright Pixel IP HDF5 Metadata Details

The HDF5 metadata elements associated with the VIIRS Bright Pixel IP are listed in the JPSS Algorithm Specification Volume II: Data Dictionary for the Common Algorithms (474-00448-02-01). The VIIRS Bright Pixel IP metadata includes all common metadata at the root, product, aggregation, and granule levels.

There are no granule level Quality Flags defined as metadata elements in the VIIRS Bright Pixel IP. Therefore, there are no entries in the N_Quality_Summary_Name/Value metadata attributes for this product.

8.1.5 VIIRS Bright Pixel IP Geolocation Details

The Geolocation for the VIIRS Bright Pixel IP uses the VIIRS Moderate Resolution Geolocation for its Geolocation.

8.2 VIIRS On-board Calibrator IP

Data Mnemonic	IMPI_VOBC_R0100
Description/ Purpose	The VIIRS Onboard Calibrator IP contains subsets of the Verified VIIRS RDR and is the primary input to offline VIIRS Cal/Val performance analysis. Included are all raw Digital Numbers (DNs) from the space view (SV), on-board calibrator blackbody (OBCBB) view, and solar diffuser (SD) view converted to truncated 12 bits. Also included are all engineering and housekeeping data including raw data from the Solar Diffuser Stability Monitor (SDSM). These data have been unpacked from VIIRS RDR application packets and assembled into convenient scan cube structures during processing by the VIIRS Build-RDR Module. As with the SDRs, metadata are included that uniquely identifies the IP and its content and coverage. Also included in the product metadata are calibrator view inventory statistics. Effectivity: S-NPP and JPSS-1
File-Naming Construct	See the JPSS CDFCB-X Vol. I, 474-00001-01, Section 3 for details.
File Size	See Table: 8.2.1-1 VIIRS On-board Calibrator Data Content Summary for size. This granule size includes output related fields and quality flags only. Geolocation and metadata attributes are not included. Additional size added by HDF5 packaging is also not included.
File Format Type	HDF5
Production Frequency	As requested

Data Content and Data Format	See Section 8.2.1 VIIRS On-board Calibrator Data Content Summary See Section 8.2.2 VIIRS On-board Calibrator IP Product Profile See Section 8.2.4 VIIRS On-board Calibrator IP Metadata Details See Section 8.2.5 VIIRS On-board Calibrator IP Geolocation Details

8.2.4 VIIRS On-board Calibrator IP HDF5 Metadata Details

The HDF5 metadata elements associated with the VIIRS On-board Calibrator IP are listed in the JPSS Algorithm Specification Volume II: Data Dictionary for the Common Algorithms (474-00448-02-01). The VIIRS On-board Calibrator IP metadata includes all common metadata at the root, product, aggregation, and granule levels. There are no granule level Quality Flags defined

as metadata elements in the VIIRS On-board Calibrator IP. Therefore, there are no entries in the N_Quality_Summary_Name/Value metadata attributes for this product.

8.2.5 VIIRS On-board Calibrator IP Geolocation Details

The VIIRS On-board Calibrator IP has no geolocation associated with it.

8.3 VIIRS Calibrated Dual-gain Band IP

Data Mnemonic	IMPI_VCDB_R0100
Description/ Purpose	The VIIRS calibrated dual-gain band IP includes unaggregated top-of-atmosphere radiance values for the dual-gain spectral bands in their nadir (3:1) and near-nadir (2:1) aggregation zones. The included radiance values from the moderate resolution dual-gain bands are identified as: M1, M2, M3, M4, M5, M7, and M13. Effectivity: S-NPP and JPSS-1
File-Naming Construct	See the JPSS CDFCB-X Vol. I, 474-00001-01, Section 3 for details.
File Size	See Table: 8.3.1-1 VIIRS Calibrated Dual-gain Band Data Content Summary for size. This granule size includes output related fields and quality flags only. Geolocation and metadata attributes are not included. Additional size added by HDF5 packaging is also not included.
File Format Type	HDF5
Production Frequency	As requested
Data Content and Data Format	This product includes radiance arrays for each of the 7 spectral bands mentioned above and additionally contains an array of 32-bit floats called btRefl. See Section 8.3.1 VIIRS Calibrated Dual-gain Band Data Content Summary See Section 8.3.2 VIIRS Calibrated Dual-gain Band IP Product Profile See Section 8.3.4 VIIRS Calibrated Dual-gain Band IP Metadata Details See Section 8.3.5 VIIRS Calibrated Dual-gain Band IP Geolocation Details

8.3.4 VIIRS Calibrated Dual-gain Band IP HDF5 Metadata Details

The HDF5 metadata elements associated with the VIIRS Calibrated Dual-gain Band IP are listed in the JPSS Algorithm Specification Volume II: Data Dictionary for the Common Algorithms (474-00448-02-01). The VIIRS Calibrated Dual-gain Band IP metadata includes all common metadata at the root, product, aggregation, and granule levels. There are no granule level Quality Flags defined as metadata elements in the VIIRS Calibrated Dual-gain Band IP. Therefore, there are no entries in the N_Quality_Summary_Name/Value metadata attributes for this product.

8.3.5 VIIRS Calibrated Dual-gain Band IP Geolocation Details

The VIIRS Calibrated Dual-gain Band IP uses the VIIRS Un-aggregated 750m Dual-Gain Band Geo.

8.3.5.1 VIIRS Un-aggregated 750m Dual-Gain Band Geo IP

Data Mnemonic	None
Description/ Purpose	Un-aggregated geolocation for each dual gain M band from the central (nadir) 3:1 along-scan aggregation zone and near off-nadir 2:1 along scan aggregation zone.
File-Naming Construct	See the JPSS CDFCB-X Vol. I, 474-00001-01, Section 3 for details.
File Size	See Table 8.3.5.2 1, VIIRS Un-aggregated 750m Dual-Gain Band Geo Data Content Summary for size. This granule size includes output related fields and quality flags only. Geolocation and metadata attributes are not included. Additional size added by HDF5 packaging is also not included.
File Format Type	HDF5
Production Frequency	As requested
Data Content and Data Format	See Section 8.3.5.2, VIIRS Un-aggregated 750m Dual-Gain Band Geo Data Content Summary

	See Section 8.3.5.3 VIIRS Un-aggregated 750m Dual-Gain Band Geo Product Profile See Section 8.3.5.3 VIIRS Un-aggregated 750m Dual-Gain Band Geo HDF5 Details See Section 8.3.5.4, VIIRS Un-aggregated 750m Dual-Gain Band Geo Metadata Details See Section 8.3.5.5 VIIRS Un-aggregated 750m Dual-Gain Band Geo Geolocation Details

Table: 8.3.5.2-1 VIIRS Un-aggregated 750m Dual-Gain Band Geo Data Content Summary

Name	Description	Data Type	Aggregate Dimensions (N = Number of Granules)	Granule Dimensions	Units
StartTime	Starting Time of each scan in IET (1/1/1958)	64-bit integer	[N*48]	[48]	microsecond
MidTime	Mid-Time of each scan in IET (1/1/1958)	64-bit integer	[N*48]	[48]	microsecond
Latitude	Latitude of each pixel (positive North)	32-bit floating point	[N*768, 5024]	[768, 5024]	degree
Longitude	Longitude of each pixel (positive East)	32-bit floating point	[N*768, 5024]	[768, 5024]	degree
SolarZenithAngle	Zenith angle of sun at each pixel position	32-bit floating point	[N*768, 5024]	[768, 5024]	degree
SolarAzimuthAngle	Azimuth angle of sun (measured clockwise positive from North) at each pixel position	32-bit floating point	[N*768, 5024]	[768, 5024]	degree
SatelliteZenithAngle	Zenith angle to Satellite at each pixel position	32-bit floating point	[N*768, 5024]	[768, 5024]	degree
SatelliteAzimuthAngle	Azimuth angle (measured clockwise positive from North) to Satellite at each pixel position	32-bit floating point	[N*768, 5024]	[768, 5024]	degree
Height	Ellipsoid-Geoid separation	32-bit floating point	[N*768, 5024]	[768, 5024]	meter
SatelliteRange	Line of sight distance from the ellipsoid intersection to the satellite	32-bit floating point	[N*768, 5024]	[768, 5024]	meter
SCPosition	Spacecraft position in ECR Coordinates (X, Y, Z) at the mid-time of scan	32-bit floating point	[N*48, 3]	[48, 3]	meter
SCVelocity	Spacecraft velocity in ECR Coordinates (dx/dt, dy/dt, dz/dt) at the mid-time of scan	32-bit floating point	[N*48, 3]	[48, 3]	m/s
SCAttitude	Spacecraft attitude with respect to Geodetic Reference Frame Coordinates (roll, pitch, yaw) at the midtime of scan	32-bit floating point	[N*48, 3]	[48, 3]	arcsecond
SCSolarZenithAngle	The angle in the spacecraft reference frame from zenith vector (negative z-axis) to the solar vector	32-bit floating point	[N*48]	[48]	degree
SCSolarAzimuthAngle	The angle in the spacecraft reference frame from x-axis to the solar vector projected onto the spacecraft x-y plane, measured counterclockwise (observer looking toward zenith (negative z-axis))	32-bit floating point	[N*48]	[48]	degree

Name	Description	Data Type	Aggregate Dimensions (N = Number of Granules)	Granule Dimensions	Units

8.3.5.5 VIIRS Un-aggregated 750m Dual-Gain Band Geolocation HDF5 Metadata Details

The HDF5 metadata elements associated with the VIIRS Un-aggregated 750m Dual-Gain Band Geolocation Metadata Details are listed in the JPSS Algorithm Specification Volume II: Data Dictionary for the Common Algorithms (474-00448-02-01). The VIIRS Un-aggregated 750m Dual-Gain Band Geolocation Metadata Details metadata includes all common metadata at the root, product, aggregation, and granule levels.

There are no granule level Quality Flags defined as metadata elements in the VIIRS Un-aggregated 750m Dual-Gain Band Geolocation. Therefore, there are no entries in the N_Quality_Summary_Name/Value metadata attributes for this product. The product metadata.

Appendix A. Data Mnemonic to Interface Mapping

For a complete list of Data Mnemonic to Interface Mapping, see 474-00001-01, JPSS CDFCB-X Vol I. The CDFCB contains Data Mnemonics, Identifiers, Collection Short Names, Interface Documents, and Collection Long Names for each JPSS Data Product and Geolocation data.

Appendix B. Common RDR Static Header Values

The Common RDR Static Header Values lists pre-defined unique values for the fields from the static header for each of the RDRs defined.
