- Operational requirements
 - Satellite Data Products
 - Product Accuracy Assessment
- Observation/Product gaps

GEO the Group on Earth Observations

an Intergovernmental Organization

Meeting at the U.S. Department of State, Washington DC. July 31, 2003

**Led to the Establishment of a
Global Earth Observing System of Systems (GEOSS)**

THE GLOBAL EARTH OBSERVATION SYSTEM OF SYSTEMS

GEOGLAM Launched by the G20 Agriculture Ministers

Objective:

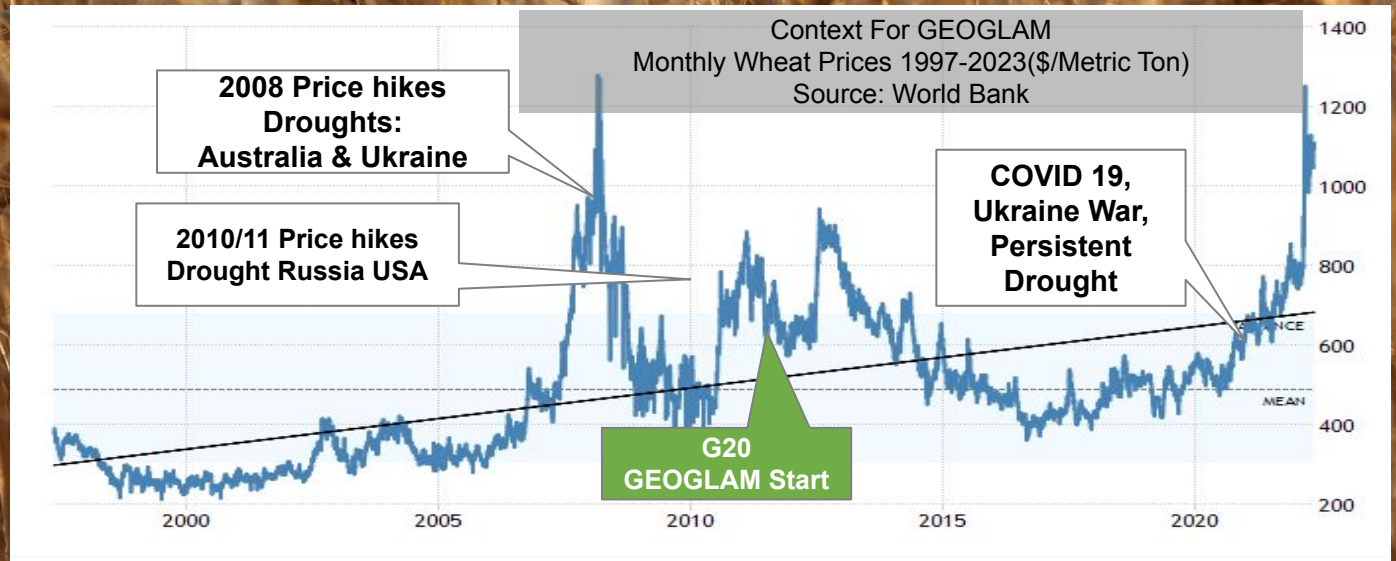

- To increase market transparency and improve food security by producing and disseminating relevant, timely, and actionable information on agricultural conditions at national, regional, and global scales
- Support markets and informing early warning for proactive response to emerging food emergencies

G20 Final Declaration

44. We commit to improve market information and transparency in order to make international markets for agricultural commodities more effective. To that end, we launched:

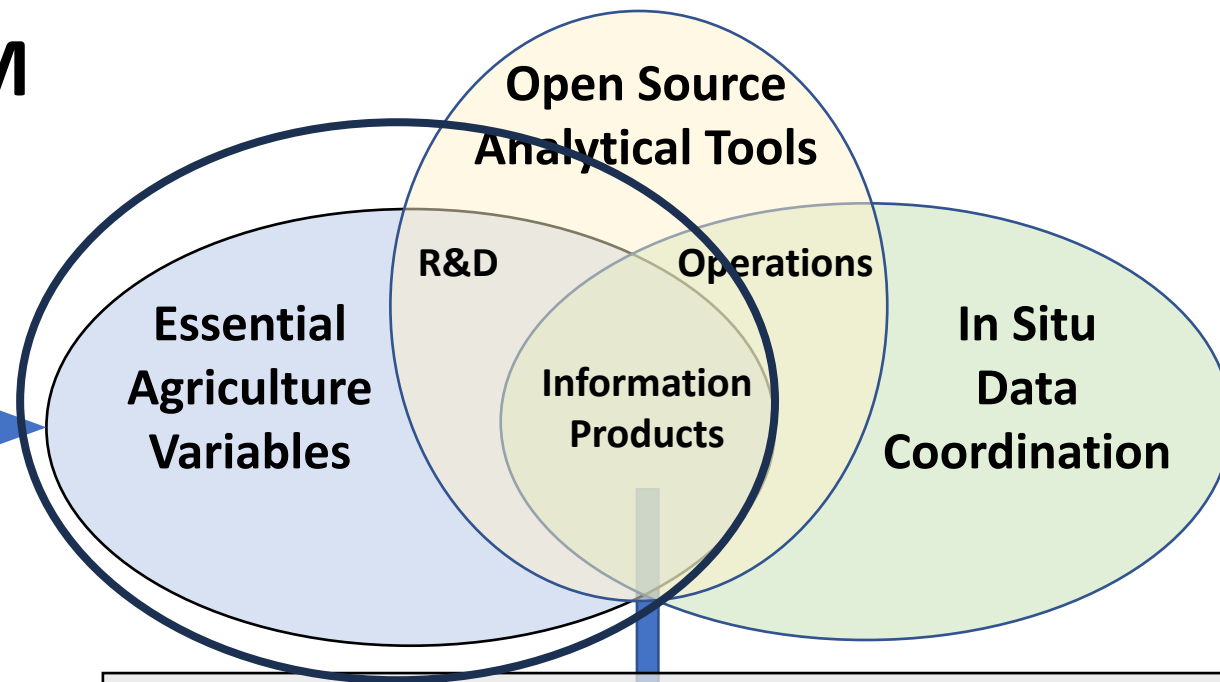

- The "Agricultural Market Information System" (AMIS) in Rome on September 15, 2011, to improve information on markets ...;
- The "Global Agricultural Geo-monitoring Initiative" (GEO-GLAM) in Geneva on September 22-23, 2011. This initiative will coordinate satellite monitoring observation systems in different regions of the world in order to enhance crop production projections and weather forecasting data.

GEOGLAM

- **Vision:** the use of coordinated, comprehensive and sustained Earth Observations to inform decisions and actions in agriculture... through a system of agricultural monitoring systems
- **Aim:** strengthen the international community's capacity to utilize Earth Observations to produce and disseminate relevant information on agricultural production at national, regional and global scales
- **Approach:** Identifying information gaps, building on existing monitoring systems – strengthening international and national capacity -
 - Emphasis on producer countries (G20+), countries-at-risk and national capacity building
 - Fostering international cooperation and collaboration

GEOGLAM Thematic Structure

Ongoing Operations – Continue and Enhance:

- AMIS Crop Monitor
- CM4 Early Warning
- GEOGLAM Knowledge Hub
- JECAM
- Essential Agricultural Variables

Needs

Capacity (co) Development Guidance
(National and International)

Early Warning & Food Security

- Crop monitor for early warning
- Seasonal Forecasts
 - Special Reports

Market Information

- Agricultural Markets Information System (AMIS)
- Commodity Crop Conditions
 - Seasonal Forecasts

**Food
Security**

Adaptation

National Adaptation Plans (NAP)
UNFCCC Supplemental
NAP Guidance

Support**

Identifying Information and Product Types

Information Products

- Crop outlook / Early warning
- Area estimate
- Yield forecast
- Production estimate
- Food Sec/vulnerability report
- Statistics reports

EO Data Products

- Crop condition indicators
- Cropland mask / Pasturelands
- Ag practices (e.g. tillage, cover crops)
- Crop type
- Biophysical variables
- Environmental variables (e.g. soil moisture)
- Weather

GEOGLAM Crop Monitor

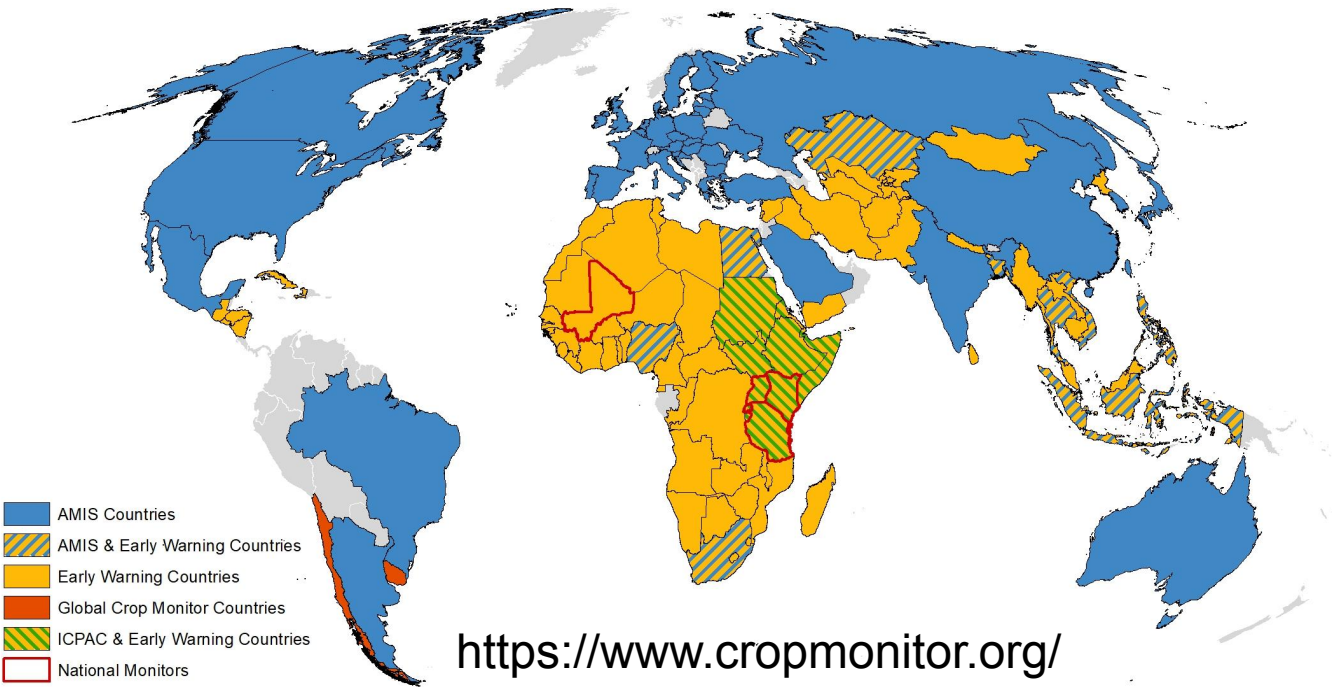

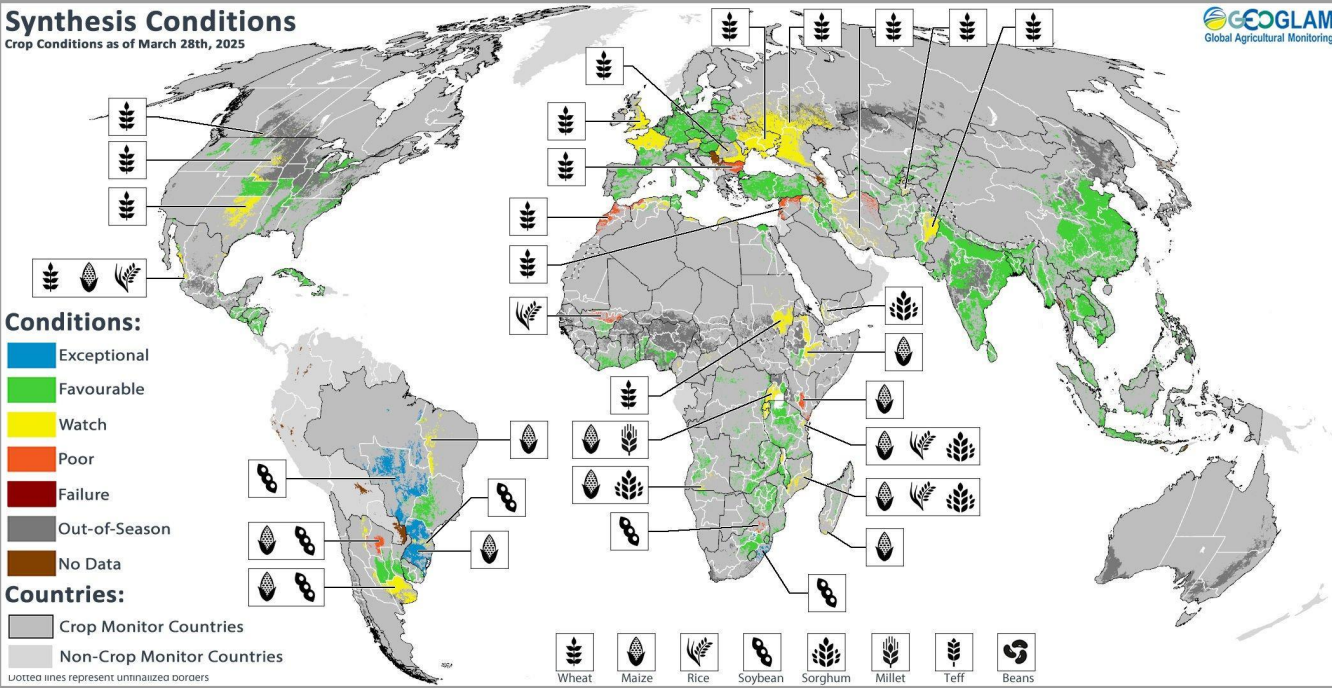

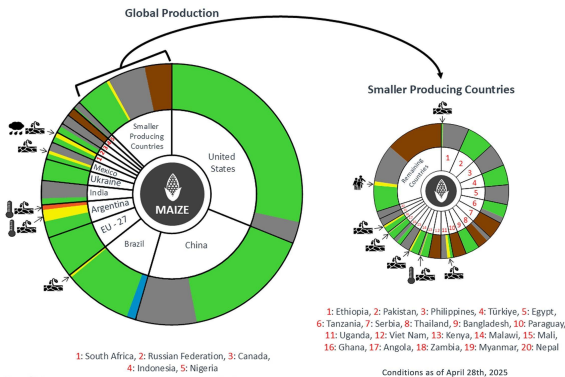

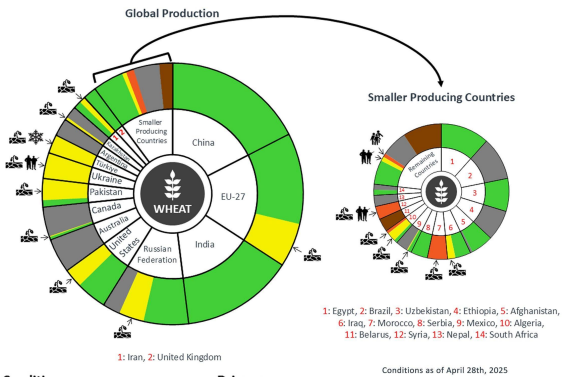

Transparent, consensus-driven and timely information on global crop conditions for policy, markets, & early warning communities since 2013

Covers 97% of global agricultural production

Produced in partnership with the main agricultural and food security monitoring agencies globally

Current Conditions	Wheat	Maize	Rice	Soybean
Compared to last month	—	—	—	↑
Compared to last year	↓	↑	↑	↑

Crop Monitor for AMIS

Overview:

At the end of April, conditions are mixed for wheat but favourable for maize, rice, and soybeans. Dry weather remains a concern for winter wheat in parts of Europe and North America. However, spring wheat sowing is beginning under favourable conditions. In the southern hemisphere, conditions for maize are generally favourable, with exceptions in parts of Argentina, northeast Brazil, northwest Mexico, and South Africa. In the northern hemisphere, sowing is also commencing. Rice conditions are favourable across most of Asia and the Americas. For soybeans, the harvest is continuing in the southern hemisphere with some areas of concern in Argentina, southern Brazil, and South Africa. Sowing is progressing in the northern hemisphere.

No. 104 – May 2025 www.cropmonitor.org 

Crop Monitor EARLY WARNING

Overview:

In **East Africa**, dry conditions continue to impact crop development despite recent rainfall improvement, and average to above-average precipitation is expected in western areas through July.

In **West Africa**, planting is ramping up with generally favourable conditions despite some localized rainfall deficits.

In the **Middle East & North Africa**, the wheat harvest is underway, and below-average rains received this season could reduce yields across many areas.

In **Southern Africa**, harvest is nearing completion, and mid-season rainfall improvements significantly benefitted crop development, except in parts of Angola, Zambia, Malawi, Mozambique, Madagascar, and South Africa where concern remains.

In **Central & South Asia**, while favourable yields are expected for winter wheat crops, there is concern for spring wheat due to dry conditions that are forecast to continue through July in most areas.

In **Southeast Asia**, rice harvests are progressing well overall, though some localized damage occurred in Myanmar from a recent earthquake.

In **Central America & the Caribbean**, land preparation for the *Primera* season is underway. Dry conditions are forecast from July to September, but an active hurricane season could bring sporadic heavy downpours.

Crop Monitor for Early Warning
Launched 2016
104 publications to date

1 | No. 32 – May 2025 www.cropmonitor.org 

GEOGLAM Global Crop Monitor

Synthesized from the Crop Monitor for AMIS, the Crop Monitor for Early Warning, and direct submissions from individual countries.

Synthesis Conditions
Crop Conditions as of April 28th, 2025

Conditions:

- Exceptional
- Favourable
- Watch
- Poor
- Failure
- Out-of-Season
- No Data

Countries:

- Crop Monitor Countries
- Non-Crop Monitor Countries

Crop conditions over the main growing areas are based on inputs, including remotely sensed data, ground observations, field reports, and national and regional experts. Regions in conditions other than favourable are labelled on the map with a symbol representing the crop(s) affected.

	Wheat	Maize	Rice	Soybean	Legend:
Current Conditions					Positive ↑ Better
Compared to last month	–	↑	–	↑	Mixed – Similar
Compared to last year	↓	↑	↑	↑	Negative ↓ Worse

See Appendix I for detailed methodology description.

Global Crop Overview

Global crop conditions at the end of April are positive for maize, rice, and soybeans, while mixed for wheat. For **wheat**, adverse conditions remain in parts of Central Asia, Europe, the Middle East and North Africa, and North America. For **maize**, conditions are generally favourable, with some areas of concern in South America and Sub-Saharan Africa. For **rice**, conditions are favourable, albeit with some spot issues in Haiti, Mexico, and Sub-Saharan Africa. For **soybeans**, harvesting is continuing in the southern hemisphere as sowing is progressing in the northern hemisphere. The remaining crops are covered in the [CM4EW](#) publication.

Global Climate Influences Overview

ENSO-neutral conditions are present. ENSO-neutral conditions are most likely through October 2025 (91 to 52 per cent chances), according to the CPC/IRI outlook. There is limited long-range ENSO predictability at this time of the year. Currently, the CPC/IRI predicts similar chances of neutral or La Niña conditions near the end of 2025 to early 2026 and lower chances of El Niño conditions during that time.

Forecast above-average temperatures during late April to late May in northwestern India and Pakistan indicate that impactful heat waves may continue in these countries. In Afghanistan, forecast hotter and drier-than-normal conditions elevate risks of negative impacts to rainfed crops and rapid reductions in snowpack.

For further details on the Global Climate Influences and Regional Climate Outlooks, see [page 6](#).

What can satellites *(help)* tell us about agriculture?

Essential Agriculture Variables

Measurable “building blocks” to understand state and change in agriculture

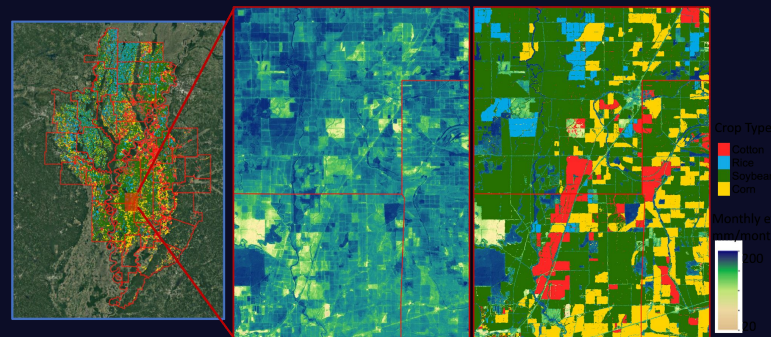

- ▶ **What nature is doing** (*what, when, where*)
 - ▶ Temperature, precipitation, flooding, wind speed, extreme weather, drought, water availability, soil moisture, evapotranspiration...
 - ▶ Disease early detection
- ▶ **What humans are doing** (*what, when, where*)
 - ▶ Cropland and crop type mapping; area estimation
 - ▶ Crop & field management; e.g. ~planting & harvest dates, irrigation, cover crop, tillage
 - ▶ Rotational grazing
- ▶ **What resulted**
 - ▶ Canopy nitrogen content and requirements
 - ▶ Yield (forecast and final)
 - ▶ Cover crop performance (N, C)
 - ▶ Forage quality
 - ▶ Emissions and sequestration**
 - ▶ Water use efficiency
- ▶ **What we can expect in the future**
 - ▶ Pest & disease risk
 - ▶ Within-season field forecast
 - ▶ Long-term responses to climate change

GEOGLAM EAV's Current Structure

Satellite Data Value Chain

❖ “Data produced must be policy-relevant and not exist for its own sake.” (UN Statistics Division, 2017)

- Clear mandate to harmonize and synergize

❖ “Essential Agriculture Variables” (EAVs) emerged as a unifying framework to maximize EO value and meet multiple information and decision needs

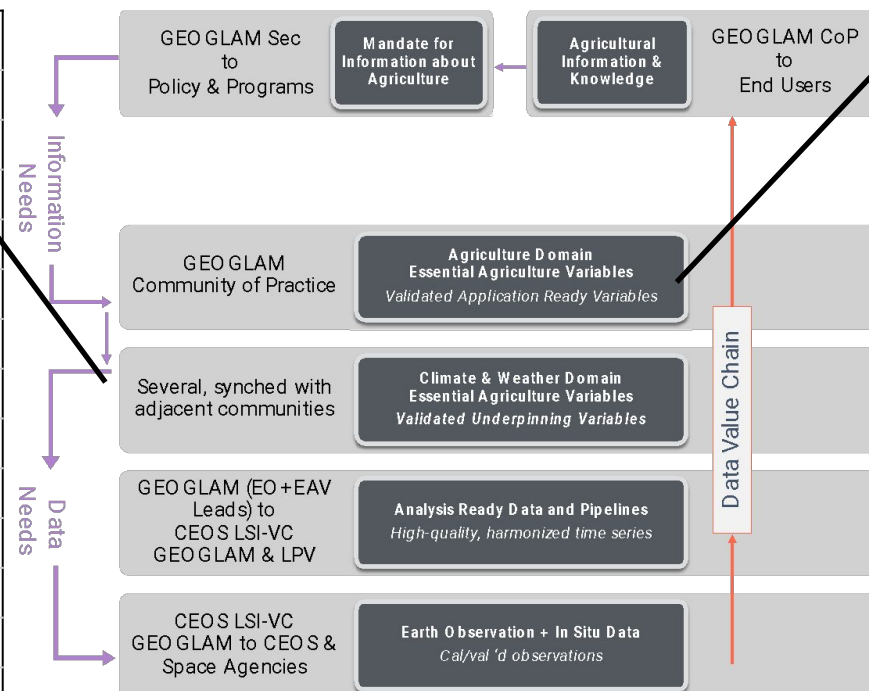

~50% the EAVs are related to ECVs

(**either exact same, same physical quantity but different resolution requirement, or linked/referenced in some way but not specified)

Met & Land Domain EAV

Land surface temp (ECV)
Air temperature (ECV)
Surface Soil Moisture (ECV)
Root Zone Soil Moisture (ECV)
Wind Speed (ECV)
Precipitation (ECV)
LAI (ECV)
fAPAR (ECV)
Incoming radiation (ECV)
Relative humidity (ECV)

GEOGLAM EAV Working Group

EAV Workshop, JRC
Ispra, May 13-15, 2025

Thoughts on GeoXO Instrument (early 2030's)

- In addition to the Land Domain Meteorological Variables – there would be an interest in the Land Imaging capability of GeoXI to provide Land Domain GEOGLAM EAV's

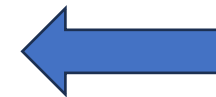

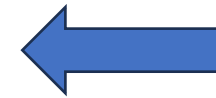

Benefits of a Geostationary Imager

From the GeoXI Web site >

High-resolution imagery is the backbone of Earth observations. Geostationary satellite imagery provides a constant view of the same area, helping forecasters and emergency officials identify and track severe weather conditions and environmental hazards as they happen to aid real-time decision-making and short-term forecasts and warnings. GXI will provide critical data for the protection of life and property and the enhancement of the national economy.

- Of particular interest for the Land and EAV community is the increased spatial resolution of 250m (.64 mic. band), **there would be considerable benefit to include a 250m (.86 mic. band)** like VIIRS and MODIS – daylight observations (the initial MODIS 250m rationale was also for small clouds).

VIIRS			MODIS		
M4	0.545 - 0.565	750	4	0.545 - 0.565	500
			12	0.546 - 0.556	1000
I1	0.600 - 0.680	375	1	0.620 - 0.670	250
M5	0.662 - 0.682	750	13	0.662 - 0.672	1000
			14	0.673 - 0.683	1000
M6	0.739 - 0.754	750	15	0.743 - 0.753	1000
I2	0.846 - 0.885	375	2	0.841 - 0.876	250

Closing Remarks

- For the land surface there would be a number of potential applications for GeoXO - especially from the imager (GeoXI)
- We would be interested in the capability to generate GEOGLAM EAV's to meet needs of the agricultural monitoring community of practice
- There is interest to better understand and engage on NOAA's plans for future agriculture product development
- Similarly, GEOGLAM would welcome a broader engagement with the Coordination Group for Meteorological Satellites (CGMS) – similar to what we are currently doing with CEOS.
